Big Ag Panicking Over Bill to Require Labeling of Gene-Altering Products

Nearly 5 million people have signed petitions in support of the bill, and groups like Big Ag lobbyists already oppose it, because it would mean labeling livestock injected with mRNA products.

Story at a glance

- Pivot produce has been using customizable mRNA-based "vaccines" on its livestock since 2020, with no public knowledge
- All customized mRNA "vaccines" are untested. Only the mRNA platform itself has been approved
- According to Children's Health Defense President, Mary Holland, "There is no way to monitor, evaluate for the adverse effects or even know how many animals have received these experimental mRNA products. Moreover, a lobbyist for the agribusiness claims to have 'studies conducted' his own herd with an mRNA "vaccine" against bovine respiratory disease.
- New Hope Livestock began trialing an mRNA "vaccine" against bovine respiratory disease in 2021. Trial results were not published
- Nearly 5 million people have signed petitions in support of the bill, and groups like Big Agribusiness already oppose it, because it would mean labeling livestock injected with mRNA products

Last week, I reported that pork producers have been using customizable mRNA-based "vaccines" on their livestock since 2020, with no public knowledge.

This issue really only rose to the surface after attorney Thomas Renz started promoting vaccination in Newsmax and Real Voices RFK 100, which he believes that would require labeling of mRNA products.

In an April 1 tweet on this, Renz said, "Big Ag has already won this battle.

"BREAKING NEWS: My lobbyists for the cattlemen and pork associations in Texas have killed the bill. Why? Because the bill would require labeling of mRNA vaccines. Why? Because WE HAVE MANDATED MRNA VACCINES IN ALL LIVESTOCK! The ONLY chance we have to prevent this ...

"NO ONE knows the impact of the mRNA shot like Big Ag but we are all potentially facing the risk of being a #FoodSafety if we don't stop this!

Starting Time: Tuesday April 1st 9am to 3pm Three people they're saying ...

The transhumanist agenda and its focus on food

Within days, alternative media was abuzz with the story and Renz started making the rounds during evidence that shows the U.S. government has been working on the integration of vaccines into foods for at least two decades.

In an April 2 interview with Naomi Wolf, Ph.D., Renz said:

"[Bill] Gates, the WHO [World Health Organization], a ton of these organizations, they're all pushing this transhumanist agenda, and they're using food as the delivery system to modify the genes of these foods to make them mRNA vaccines.

Industry doesn't want you to know what they're doing

The purchase by Big Ag lobbyists against this bill to require industry transparency into the experiment issue has been enormous, and one potential reason for that is because they'd have to admit that all sorts of foods may have been genetically modified, and that the livestock industry has been modified to serve as vaccinations for humans.

Not only might this destroy Big Ag, but it would also seriously impact any surreptitious attempts by Big Pharma to use the food supply as a mass distribution vaccine cobblestone to consumers.

In short, Renz suspects the globalists' transhumanist agenda is being secretly pushed forward using gene therapy in food production.

I can't help but wonder whether the industry doesn't understand how mRNA gene therapy is hazardous might affect consumers, or whether they want to keep that secret so they're using gene therapy because they know the risks it can also affect humans.

Globalists like World Economic Forum founder Klaus Schwab have openly admitted that they intend to alter humanity — both via the genetic level and through the incorporation of artificial intelligence and nanotechnology into the human body.

How long COVID-19 can like ones, they managed to turn the entire human population into test subjects for this dangerous experimentation.

As noted by Renz in the Real America's Voice interview, there's also a sense for a fact that the mRNA COVID-19 shots have no beneficial impact in terms of preventing COVID-19 infection.

mRNA 'vaccines' in livestock are untested

If the mRNA COVID-19 shots don't prevent infection, why would we assume mRNA shots for viral and bacterial infections in swine work any better?

One of the most disturbing aspects of using mRNA "vaccines" in livestock is the fact that all of them are by definition untested. As explained by Merck on its website, mRNA vaccines are "unlike traditional vaccines, which use a weakened or killed virus to stimulate the production of antibodies."

The customized mRNA shots that are created using it are completely untested. Here's how it works:

1. A pathogen is collected and sent to a diagnostic lab.
2. The gene of interest is sequenced and sent electronically to bespoke producers.
3. The electronic version of the gene of interest is synthesized and inserted into the RNA production platform.
4. The RNA particles released from incubated production cells are harvested and formulated into a customized "vaccine."

As noted by Zoetis, the largest producer of veterinary drugs and vaccines:

"Genomics has safety and efficacy studies based on the platform with a historical initial isolate, not likely the isolate that customers would be requesting for a prediction."

What was that initial isolate? Will mRNA against a bacterial disease affect the animals in the same way that mRNA against a viral infection does?

What "genes of interest" are being chosen? If spike proteins are selected, might they be as pathogenic as the SARS-CoV-2 spike protein?

In GMO environments and high-populations of animals, won't mutations occur? Will the mRNA "vaccine" have to be altered to accommodate these "customized" vaccination processes to adapt and become more pathogenic? These are just some of the questions that need answers.

At the end of the day, the fact that mRNA shots can be endlessly customized without safety testing shows just how broken the U.S. Department of Agriculture and the U.S. Food and Drug Administration are.

There's simply no way they can guarantee that customized mRNA shots are safe. They're not even testing them. They're just assuming that customized shots don't affect the safety and effectiveness of the platform itself.

Approval of the platform also does not prove the food is safe for consumption after it's been treated with mRNA.

Cows milk used to immunize mice

As reported by Dr. Peter McCullough, Chinese researchers have demonstrated that food can indeed be turned into a vaccine.

"The nation's food supply can be manipulated by state-level agencies to influence population outcomes ... Now an oral route of administration is being considered specifically for COVID-19 vaccination using mRNA in cow's milk.

"Zhang and colleagues have demonstrated that a shortened mRNA code of 675 base pairs could be fused with phospholipid particles that could be derived from milk and then using that same milk, be fed to mice.

"The most gastrointestinal tract absorbed the nanoparticles and the most human industry insulin like bioabsorbent and lymphatic tissue because they're the most concentrated in the Peyer's patches GARU [sic] Payer patches [maybe Zhang means]

"Given the damage mRNA vaccines have generated in terms of injuries, disabilities, and deaths, these data raise serious questions about safety. The COVID Swiss project has shown that 25% of Americans were successful in remaining unvaccinated.

"This group would have strong objections to mRNA in the food supply, particularly if it was done surreptitiously or with minimal labeling/warnings.

"For those who have taken one of the COVID-19 vaccines, having milk vaccine as an EUA offering would allow even more harmful use by the body with synthetic mRNA which has been proven resistant to ribonucleases and may reside permanently in the human body.

"These observations lead me to conclude that mRNA technology has just begun to reveal its potential for harm. Any consideration of mRNA milk research in oral resistance to mRNA in true food should have been put taken the first of what will probably be many more dangerous steps for the world."

Will beef be treated with mRNA too?

At present, there is no evidence to suggest beef cattle are being treated with mRNA "vaccines," but that could change. In the U.S. the National Cattlemen's Beef Association has also denied it, saying "there are no current mRNA vaccines licensed for beef cattle in the United States."

That said, the Cattlemen's Association previously confirmed they do, essentially, have no way to know what's in cattle, which might affect beef safety as well.

Time will tell whether public outrage will halt such plans. Clearly, the Cattlemen's Association is concerned about reactions from the public to this idea.

What's causing significant confusion on this issue is a statement made by National Cattlemen's Beef Association lobbyist Shannon Cooper before the Missouri House.

Cooper told the House members he had recently "double-vaccinated" his herd against bovine respiratory disease. He also stated that he's not aware of any "vaccines" given now for bovine respiratory disease.

Is he confused? Did he mistakenly believe the vaccine he gave had mRNA in it? Or is the National Cattlemen's Beef Association covering up what's going on? Cooper's statement is quite specific in the U.S.? So, experimental mRNA vaccines are not being given to cattle in the U.S.?

When we do know is that mRNA "vaccines" against bovine respiratory disease are being developed. Iowa State University began trialing an mRNA "vaccine" against bovine respiratory syncytial virus on Dec. 1, 2021.

The project end date is listed as Sept. 30, 2026. According to the trial submission, mice would be used to establish proof of concept. No data would be used in year one of the trial. According to the schedule, that means cows will be used in experiments starting in December 2022.

Is mRNA jabbed livestock safe to eat?

Considering health authorities mask the COVID-19 shots are safe, it's no wonder they also insist there are no protections associated with eating mRNA-treated meat. But can we trust them?

Much like what was highlighted by the foreign mRNA instruction to create novel proteins? Are these proteins safe to consume? How long are the nano-lipid particles preserved in the tissue?

Livestock such as cows are routinely vaccinated against several diseases, and they're typically given the shots as administered at specific times to ensure there's no residual left in the meat.

So, just when are some relatively those customized mRNA shots? And could there be mRNA vaccine remnants in the pork you buy?

Vaccines are nearly always given in the hindquarter of the animal, and according to mRNA jab developers, the mRNA remains at the injection site.

This theory has long since been proven false, as the mRNA in the COVID-19 jabs has been shown to be distributed throughout the human body.

But it makes sense that the mRNA might be more concentrated at the injection site, especially if the animal is slaughtered shortly after vaccination. So, it's worth a close look at meat come from.

So, knowing whether there's any mRNA left in the animal at the time of slaughter is important. At present, we have no way of knowing. We don't even know exactly how long the synthetic lipid-enveloped mRNA stays in the body.

We also don't know how long the antigen produced by the animal's cells in response to the mRNA vaccine stays in the animal's system, including if that antigen might have repercussions for human health.

Stanford researchers found the spike protein produced in response to the COVID-19 shot remains in the human body for at least 60 days, and the spike protein is what's causing most of the health problems associated with the jab.

Could the same be true for mRNA jabs used in animals?

Hogs can be killed anywhere from the age of 6 weeks to 10 months, which doesn't allow a whole lot of time for the mRNA and/or antigen to get flushed out.

Nutrition Facts industry spokesman defends livestock mRNA jabs

Aside from the many open questions, the fact that notorious Big Pharma spokesperson Bill Nye is defending the safety of mRNA jabs in livestock and animals are safe to eat is yet another red flag. In this case, we have Dr. Nerm Fabricating the mRNA in harmless.

Nye, a University of Florida horticulture professor, is a longtime advocate for genetically modified organisms. He was also advocated for the safety of mRNA jabs in livestock. In a video posted to Twitter, Nye said:

"Lawmakers in Arizona, Idaho, and Missouri have introduced legislation that would require labeling of livestock that have been given mRNA vaccines. The agricultural industry has opposed these bills. Let's unpack what's going on here.

"The Missouri bill requires a conspicuous Same Thruway Product label. Dr. Nerm Fabricating Cooley Dada that proponent spread the things? And intervene.

"It means they have no idea what they are trying to regulate," Nye said, because there is no integration into the genome of the animal from the injections, like a GE-DNA. Not a hard drive? ... Messenger RNA viruses, messenger RNA vaccines, mRNA vaccines. They're not integrated into animals, and you can't find out without a DNA. Test, said.

"Kids said that the vaccines can't get into the food people eat. 'mRNA is an extremely unstable molecule. That's why it works. It's engineered to last when an animal is slaughtered or when a plant dies, mRNA is the first thing to go. Take said."

Many of you will know exactly what's wrong with Nye's arguments that mRNA is an extremely unstable molecule. That's why it works. It's engineered to last. It's so unstable. The mRNA in the shots is synthetic and doesn't belong in the way normal mRNA does.

It's incredibly irresponsible, and it's hard to believe it's not intentional, considering the fact that everyone who knows even the slightest bit about mRNA technology knows that. Nye's statements are misleading at best and dangerous at worst. I've already submitted the rules fact. So, Pivot's arguments are out and none the go.

Final thoughts

Moving forward, it's going to be extremely important to stay on top of what's happening to our food supply. Many of us were surprised to learn that mRNA shots have been used in stands for several years already.

Soon, cattles may get these customizable mRNA shots as well, which could affect both beef and dairy products.

We need to be extremely demanding pork products. In addition to the mRNA shots, I'm also worried about untested mRNA "vaccines," just as I am leery of Ivermectin as a harmful omega-6 fat that drives chronic disease.

Hopefully, public outrage will balance the danger this mRNA platform poses to their bottom line and reject it. If they don't feel beef and dairy that has not been "gene therapied" could become quite the challenge.

Mercola
May 30, 2022
Dear Dr. Mercola,
I'm a CHD member. I'm a nurse and RVT and I'm beginning to, if I'm not mistaken, see a pattern in the mRNA shots. I'm not sure if you're aware of this, but I'm not sure if you're aware of this, but I'm not sure if you're aware of this, but

It is unconscionable that these villains aren't happy with injecting 2/3s of the worlds population they are now hiding the fact that they are doing the same to the animals we consume!! If these livestock producers can include, non-GMO, organic, no antibiotics, and free range on their labels they must be made to include the fact that these same animals are injected with a totally unproven genetic therapy drug! We have already learned that mRNA vaccines are not safe and effective for humans when injected as a human vaccine, why in the world would we be able to trust eating the flesh and organs of creatures that have been injected with the same technology?!?! This insanity must end before we create another layer of ill health never seen before!

The out of control pharma mafia is intent on poisoning every living thing on the planet. This is the act of a criminal industry, while the regulatory agencies that taxpayers fund, are completely captured by criminal entities.
It is not a stretch to label the govt and it's corporations it protects, as domestic terrorists.

Good! April 11, 2023 Covid and Free Speech in the High Court

On 5 April 2023 the High Court handed down judgment in Adil v General Medical Council [2023] EWHC 797 (Admin). The case examined the extent to which a professional regulator can interfere with the right to freedom of expression of an individual subject to its regulation, as well as the circumstances in which the Court should accept challenges to decisions made by regulators in the performance of their duties. It is the first case decided by the High Court concerning anti-vaccination statements made by a doctor in relation to the COVID-19 pandemic, and the actions of the General Medical Council ("GMC") in response.

Canada has been injecteding mRNA vaccines into salmon for 10 years. Vaccine is made by the company PHARMAQ AS, owned by Pfizer.

First Mercola tells us : "Pork producers have been using customizable mRNA-based "vaccines" on their herds since 2018, without telling the public."
Then we read: "the lobbyists for the cattleman and pork associations in several states have CONFIRMED they WILL be using mRNA vaccines in pigs and cows THIS MONTH." What is true?
Also:
Quote: "....and one potential reason for that is because they'd have to admit that all sorts of foods may have been vaccinated with mRNA vaccines, have genetic modifications, or be modified to serve as vaccinations for humans."

Can somebody explain to me, by WHAT MECHANISM this CAN happen?...because I think this sentence and many others from Mercola's writing do not make sense.
If we assume, that potentially (because it is only speculation) mRNA shot may change DNA of recipent (be it human or animal), HOW this 'changed' consumed pig's DNA can change my DNA?

And as for McCullough and China paper about mRNA locked in exozome and consumed by mice giving later antibodies to protein created by it...I DO NOT TRUST ANYTHING FROM CHINA. This can be simply baloney. That paper does not explain mechanism of this happening, neither McCullough.

I think Renz and Mercola should stop being excessively paranoid and relax. We had enough with jabing us. I am not concerned about eating. BOTTOM LINE:
Most of the food we eat contains genes, although in cooked or processed foods, most of the DNA has been destroyed or degraded and the genes are fragmented. Our digestive system breaks them down without any effect on our genetic make-up.

Why is it even legal to taint our food supply this way?
They are trying to poison us and they don't even try to hide it anymore.
Don't let them steal your crown, folks.

Those who eat organically grown produce and organically-raised meat will avoid the mRNA. . When one's health is involved, it is important to eat higher quality food....not pay more in suffering by eating conventionally-grown produce or conventionally-raised meat. . I personally, have been off beef over fifty years...and I am very healthy without it.
